

CLAIMS

5 What is claimed is:

1. A method for automatic formation of electronic communities,
comprising the steps of:

a) providing a database for unique user identifier and associated
10 search strings;

b) entering a first unique identifier for a first user and a first
associated search string into said database;

c) determining whether said first search string substantially
matches a search string previously stored in said database;

15 d) querying said first user whether said first user wants to join a
community in response to a matching search string;

e) querying second user associated with said matching search string
whether said second user wants to join a community with said first
user; and

20 f) forming a community if said first user and said second user both
respond affirmatively to community formation.

g) causing said community will initially be anonymous - without
specific identifying information until both parties agree to
identify themselves to the other.

25 h) displaying matches according to user preference to have matches
sorted by date, closeness of search term, volume of similar

searches, or a combination of some or all of these variables.

i) contacting these additional matches will be accomplished in the same manner as d)-g) shown above.

j) creating MySearch pages with the results of various searching and matching shown, as well as

k) the creation of certain organizational Searching and Matching pages to collect with permission the results of various searches and matching using this invention and making same available with appropriate levels of security

2. The method of Claim 1 wherein step f) further comprises the step establishing a connection between said first user and said second user over the Internet.

3. The method of Claim 1 wherein steps d)-g) provide the user with means of ordering matches and sorting them by virtue of date, volume, or closeness of the search term.

4. The method of forming communities in claim 1 comprising the steps of two or more persons over a telephone wireless or landline system, the Internet, a computer network, or a standalone computer;

5. The method of creating a database referenced in claim 1 that also includes both new and previously created communities formed during a match on a standalone computer, networked computer or telephone system;

09934093-112801

6. The method of omitting the creation of a new community in claim 1 if (one or more) relevant community(ies) already exist(s), wherein only the present user is asked to join an existing community;
- 5 7. The method of determining the similarity of searches in claim 1 that can be determined using string matching;
8. The method of determining the similarity of searches in claim 1 using external contextual identifiers;
- 10 9. The method of determining the similarity of searches in claim 1 that can be determined using a sounds-like program;
- 15 10. The method of determining the similarity of searches in claim 1 that can be determined using natural language processing in which the underlying meaning of the word or phrase is matched against the underlying meaning of the words or phrase of prior searches;
- 20 11. The method of determining the similarity of searches in claim 1 that can be determined using a neural net program;
12. The method of teaching a neural net in claim 1 to learn from previous matches;
- 25 13. The method of applying in claim 1 a system of security permissions where similarity of searches is constrained by users or an administrator or employer or supervisor with a system of security permissions controlled automatically or by the intervention of an actual person granting security based upon any criteria. These
- 30 security permissions can include but not be limited to: years of employment, department, job title, by manual approval, by employee number, by security level, by need to know, by organizational unit,

by knowledge circle, by geography determined by part or all of a phone number, zipcode, or other means;

14. The method of inputting and outputting of claim 1 where said
5 method of input of the search terms and output communications can be via: a) the spoken word into a phone, b)email, c) fax or d) web email;

15. The method of claim 1 wherein the search is performed on a
10 standalone computer or other communications device to: a) telephone communications network, b)an intranet, c) an extranet, d) the Internet;

16. The method of providing in claim 1 to provide users with control
15 over being notified of a match; and giving users the ability to turn such notification on and off, or to permit only recognized lists of users to be matched.

17. The method of identifying in claim 1 an identifying string for
20 the user's password and his or her: a) email address, b) fax number, c) identifier from a redirector source, d) telephone number;

18. The method of setting the level of matching desired with respect
to closeness, age of search, security and other constraints;

19. Choosing by users in claim 1 the nature of community they wish
to be invited into (e.g., communities that are public, private, narrow, broad, computer, telephonic, text or voice, limited by geography, etc.);

20. Providing in claim 1 a community with one or more of the
following functions: telephonic, chat, bulletin board, links to

related goods and services, other chats, other bulletin boards, Usenet groups, other groups and functions;

21. The method of using in claim 1 a telecommunications system
5 consisting of voice communication over wired or wireless digital or analog phone systems for matching;

22. The method of permitting users to choose to take advantage of speech to text and text to speech technologies.

10

23. The method of claim 1, including means to permit language translation so users can, for example, communicate within a single community in any language including Chinese, Russian, Spanish, Arabic, Hebrew or English, and so forth.

15

24. The method of claim 1 as well as any other means of creating community including means to permit members of a community formed by the present invention to

20

1. conduct joint searches and to post same for private or public viewing
2. rate jointly and severally the content, consistency, depth and relevance of websites as well as other information valued by the community.
